

# Customer Notes Summary

## General

- Login page should come first before moving to any page. The login page should also be very basic and no indicators of a two tier system (admins/profs). Based on their credentials, the backend should identify the type of user.
- Keep the functionality/layouts similar to what they have or what is familiar to them
- Nice to toggle between engineering programs when looking at forms/data (filter by engineering program)
- Data from forms should be uploaded directly, not from a file upload
- Forms should be able to have an attachment piece where profs can upload an example of homework/assignment to provide support for their GA form. The form should primarily be for numbers of students in each skill category as well as answers to questions. No need for overcomplication.
- Help/tutorial/setup wizard is something Gina and Dave are interested in.

## Our Group

- They like the idea of a home page being a news page where they can easily see updates, quick links, carousel, etc. (basic website home page). The info about accreditation should be a sub page.
- Professors submit the OBA form whenever they teach an undergraduate course
- Searching a GA by class is helpful for profs, searching a GA by it's identifier is helpful for admins when needed
- They like the feedback section being separate from the forms page. The profs can submit recommended changes to a GA, data taken, OBA process, etc.
